

Peste des Petits Ruminants virus detection by molecular biology

Emission date : 23/06/2018

CIRAD Reference: 64180622

Received : 20/06/2018

Sample reception date : 22/06/2018

Analysis date : 23/06/2018

Samples : 13 bloods and 1 Nasal swab

Method: 2 RT QPCR and one RT-PCR PPR

CONCLUSION

Two samples were found positive (blood 6 and 13) by 2 techniques (RT-QPCR and RT-PCR), one sample (swab 14) was found doubtful in RT-QPCR and 2 samples (blood 3 and 5) were found to be weakly positive in RT-PCR.

For one sample (Blood 12) RNA was not detected by the housekeeping gene amplification, it may be due to degradation of the sample during the long and chaotic travel between the laboratories, results for this sample are uninterpretable.
